the front moves $\mathrm{F}\,\Delta t$ in Δt

T climbs Δt over a distance $\mathrm{F}\,\Delta t$:
steepest slope of $T = \Delta t\,/\,(\mathrm{F}\,\Delta t) = 1/\mathrm{F}$

fast marching at S's 0.1 m cell

Pythagoras' rule on the two slopes:
$\Big((T-a)/h\Big)^2 + \Big((T-b)/h\Big)^2 = 1/\mathrm{F}^2$
