

the node at (3.5, 3.6)

average of its four neighbours:

$(0.9429 + 0.9336 + 0.9482 + 0.9247)$
$/\ 4 = 3.7494/4 = 0.93735$

An average lies between the smallest and the largest of the four values, so one neighbour is always lower (unless all four are equal).
