

Without a pipeline

3 saved files

ohe_sex.pkl, ohe_embarked.pkl, clf.pkl

```
load the 3 files
sex = ohe_sex.transform(...)
embarked = ohe_embarked.transform(...)
age = take the Age column
rest = take the other 4 columns
x = np.concatenate(
    (rest, age, sex, embarked))
clf.predict(x)
```

every training step written again,
in exactly the training order

With a pipeline

1 saved file

pipe.pkl

```
load pipe.pkl
pipe.predict(x)
```

every step is inside the pipeline;
change training, save again, this code stays
