

f = the new match's features: toss lost, Mumbai, sunny

$$P(\text{win} \mid f) = \frac{P(f \mid \text{win}) \times P(\text{win})}{\cancel{P(f)}}$$

$$P(\text{loss} \mid f) = \frac{P(f \mid \text{loss}) \times P(\text{loss})}{\cancel{P(f)}}$$

same denominator in both:
dividing by it never changes which is larger, so drop it
