

$$\sigma(z) = \frac{1}{u}, \quad u = 1 + e^{-z}$$

at $z = 2$: $u = 1 + 0.135 = 1.135$

reciprocal rule: $\frac{e^{-z}}{(1 + e^{-z})^2}$

$$0.135/1.135^2 = 0.105$$

split: $\frac{1}{1 + e^{-z}} \cdot \frac{e^{-z}}{1 + e^{-z}}$

$$0.881 \times 0.119$$

$$\sigma(z) (1 - \sigma(z))$$

$= 0.105$, the same slope
