

low-variance sampler: start $r = 0.12$, then a pointer every $1/M = 0.2$

copies of particles 1 to 5: 0, 2, 1, 0, 2 every particle with weight ≥ 0.2 is kept

plain (multinomial) resampling: five independent random numbers

copies of particles 1 to 5: 0, 2, 0, 0, 3 particle 3 (weight 0.33) is lost

grey slivers: particles 1 and 4 (weight 0.0031 each); blue: particles 2, 3 and 5 (weight 0.3313 each)
