explicit graph

every vertex and edge is built and stored before the search

our room: 76 vertices, 114 edges

implicit graph

neighbours(cell): read the grid, return the free cells left, down, up and right of it

only the cells the search has reached are stored; edges are made when the search asks for them

blue: cells reached; red ring: the cell being expanded;
orange: the neighbours just made; grey: cells not made yet
