

1. State H_0 and H_1 H_0 : $\mu = 6$, H_1 : $\mu > 6$

2. Choose the significance level α usually 0.05 or 0.01

before
seeing data

3. Check the assumptions normal? σ known? data type? groups?

4. Choose the test z-test, t-test, chi-square test, ANOVA, ...

choose
the tool

5. Name the test statistic z for a z-test, t for a t-test

6. Conduct the test compute the statistic from the sample

7. Decide reject H_0 , or fail to reject H_0

use
the data

8. Interpret what the decision means for the question
