

numeric column
any shape

```
graph LR; A[numeric column  
any shape] --> B[choose cut-offs  
e.g. 1st and 99th percentile]; B --> C[detect  
lower = 1st percentile  
upper = 99th percentile]; C --> D[trimming  
remove the rows]; C --> E[capping  
move values onto the limits  
= winsorization];
```

The flowchart illustrates a process for handling outliers in a numeric column. It starts with a light blue box labeled 'numeric column' and 'any shape'. An arrow points to an orange box labeled 'choose cut-offs' with the example 'e.g. 1st and 99th percentile'. Another arrow points to a purple box labeled 'detect' with 'lower = 1st percentile' and 'upper = 99th percentile'. From the 'detect' box, two arrows branch out: one to a red box labeled 'trimming' with 'remove the rows', and another to a green box labeled 'capping' with 'move values onto the limits' and '= winsorization'.

choose cut-offs
e.g. 1st and 99th
percentile

detect
lower = 1st percentile
upper = 99th percentile

trimming
remove the rows

capping
move values onto
the limits
= *winsorization*
