

## Without a pipeline

### 3 saved files

ohe\_sex.pkl, ohe\_embarked.pkl, clf.pkl

```
load the 3 files
sex = ohe_sex.transform(...)
embarked = ohe_embarked.transform(...)
age = take the Age column
rest = take the other 4 columns
x = np.concatenate(
    (rest, age, sex, embarked))
clf.predict(x)
```

every training step written again,  
in exactly the training order

## With a pipeline

### 1 saved file

pipe.pkl

```
load pipe.pkl
pipe.predict(x)
```

every step is inside the pipeline;  
change training, save again, this code stays
